

Prospect-to-Cash Modules & Data Preparation Guide

Learn every module, then prepare the knowledge the chatbot uses

Item	Detail
Document version	1.0
Date	24 September 2026
For	Chatbot team and business users (sales, customer service, credit, A/R) who help write content
Part A	The 18 Prospect-to-Cash modules — what each one is and how they connect
Part B	How to prepare the 3 kinds of chatbot data: knowledge files, Excel Q&A, glossary
Part C	Fill-in templates for business users

Contents

Part A — Learn the modules

1. The Prospect-to-Cash process at a glance
2. All modules in one table
3. How to study a module
4. Module-by-module summary (what the chatbot knows today)

Part B — Prepare the data

5. How the chatbot uses data
6. Knowledge files (Markdown)
7. Excel Q&A files
8. Business glossary
9. Where to get content
10. Quality rules and checklist
11. Weekly routine and roles

Part C — Templates

12. Module fill-in template
13. Q&A and glossary fill-in templates

1. The Prospect-to-Cash process at a glance

Prospect-to-Cash is one chain: it starts when a company first shows interest and ends when their payment is applied. Each module hands its record to the next one. Learning the modules in this order makes each one easier, because you always know where the record came from and where it goes next.

Returns & Corrections can happen at any point after shipment. CRM setup, follow-ups, the form/field guide and the cross-process guide support every step.

2. All modules in one table

Module	In plain words	Comes from	Goes to	Knowledge file	Q&A rows
Prospect	A company that might buy but is not a customer yet.	—	Lead	prospect.md	7
Lead	A record that someone is interested: source, quality, status.	Prospect / Customer	Opportunity	lead.md	5
Opportunity	A qualified chance to sell, with stage, probability and expected value.	Lead	Estimate	opportunity.md	6
Estimate	Internal working record for pricing and configuring what will be offered.	Opportunity	Quotation / Customer Order	estimate.md	7
Quotation	The proposal sent to the prospect or customer, usually printed from the estimate.	Estimate	Customer Order	quotation.md	6
Customer	Master record: bill-to, ship-to, terms, credit limit, defaults.	Prospect (converted)	Customer Order	customer.md	8
Customer Order	Sales order header: customer, dates, terms, status, holds.	Estimate / Quotation	Order Lines	customer_order.md	9
Order Lines & Releases	What items, quantities and delivery dates are sold.	Customer Order	Shipment	customer_order_line.md	10
Pricing & Discounts	Price lists, price codes and discounts used on estimates and orders.	Customer / Item	Order Lines	pricing.md	7
Credit Review & Hold	Credit limit and credit hold rules that can block shipping.	Customer Order	Shipment	credit.md	8

Module	In plain words	Comes from	Goes to	Knowledge file	Q&A rows
Fulfillment & Shipment	Picking, packing and shipping order lines; stock availability.	Order Lines + Credit OK	Invoice	shipment.md	6
Invoice & Credit Memo	Billing the customer for shipped lines; credit memos for corrections.	Shipment	Payment	invoice.md	5
Payment & A/R	Receiving money and applying it to open invoices.	Invoice	— (cycle complete)	payment.md	8
Returns & Corrections	RMAs, credits and fixing mistakes after shipping or invoicing.	Shipment / Invoice	Credit Memo / Reship	returns_and_corrections.md	4
CRM Setup & Navigation	Codes, statuses and setup values the CRM forms depend on.	Supporting	Supporting	crm_setup.md	9
Customer Follow-up	Interactions, tasks and relationship management.	Supporting	Supporting	customer_follow_up.md	7
Form & Field Guide	Where each form and key field is, and what it means.	Supporting	Supporting	form_field_catalog.md	12
Cross-Process Guide	Questions that span several modules, end to end.	Supporting	Supporting	faq.md	8

3. How to study a module

Use the same five questions for every module. When you can answer all five without notes, you know the module well enough to review chatbot answers for it.

#	Question	Example (Customer Order)
1	What is this record? What does it mean for the business?	A confirmed sale: header with customer, terms, dates, status
2	Which Syteline form is it on, and what are the key fields?	Customer Orders form: Order, Customer, Status, Credit Hold, Terms
3	What are the steps to create or process it?	Check duplicates → create header → add lines → review → release
4	What comes before and after it?	From an accepted estimate → to order lines, shipment, invoice
5	What usually goes wrong, and how is it fixed?	Credit hold blocks shipping → credit team reviews and releases

Tip: learn with Syteline open

Open the matching form in the AIDEMO configuration while you read each knowledge file, and find every field it mentions on the screen. Seeing the real form makes the module stick far faster than reading alone.

4. Module-by-module summary

Each module below lists the topics its knowledge file already covers, with the one-line summary from that file. This is exactly what the chatbot knows today. Anything missing here, the chatbot cannot answer well.

Prospect

A company that might buy but is not a customer yet. Comes from: — · Goes to: Lead · File: prospect.md · 7 Q&A rows

Topic covered	What it says
Record meaning and forms	Prospect is an organization before customer setup; linked sales activity lives in its own records.
Create and qualify a prospect	Avoid duplicates, attach contacts, log interactions, and carry a qualified need into a lead or opportunity.
Move prospect to customer	Prospect conversion creates a customer and reassigns linked activity; verify the result.
Common questions and checks	Look for conversion, references, and site context before assuming missing data.
Prospect data to capture and why it matters	Separate company identity, person identity, ownership, and interaction history.
Conversion checks and exceptions	Conversion is a record handoff that must be checked on both sides.

Lead

A record that someone is interested: source, quality, status. Comes from: Prospect / Customer · Goes to: Opportunity · File: lead.md · 5 Q&A rows

Topic covered	What it says
Record meaning and form fields	A lead tracks interest and qualification; its opportunity is a linked record, not a replacement.
Capture and progress a lead	Capture the party, need, owner, status, and next contact before creating an opportunity.
What to review when a lead stalls	Use linked records to distinguish interest, proposal, and booked order.
Lead field guide and qualification decision	Qualification depends on the party, need, owner, and next action; status labels are local.
Handoff and exception examples	Related records show progress beyond the lead, while missing values require setup or security review.

Opportunity

A qualified chance to sell, with stage, probability and expected value. Comes from: Lead · Goes to: Estimate · File: opportunity.md · 6 Q&A rows

Topic covered	What it says
Record meaning and form map	Opportunity is the sales pipeline record; tasks and estimates make the pursuit actionable.
Create and manage an opportunity	Keep status, probability, close date, tasks, and quote links current.
Forecast and handoff	Forecast, win, customer conversion, and order booking are distinct checkpoints.
Opportunity field and task interpretation	Pipeline estimates, task completion, and transactional order status are different evidence.
Review a stalled or inconsistent opportunity	Trace the quote and order rather than treating “won” as proof of booking.

Estimate

Internal working record for pricing and configuring what will be offered. Comes from: Opportunity · Goes to: Quotation / Customer Order · File: estimate.md · 7 Q&A rows

Topic covered	What it says
Meaning, status, and forms	An estimate is a proposal record; its status must not be confused with an order or payment.
Prepare the header	A valid header establishes quote identity, validity period, party, and commercial terms.
Prepare and review lines	Price and delivery must be reviewed at line level, especially after quantity changes.
Handoff after acceptance	Copying an estimate begins order entry; verify recalculated fields and new order status.
Header and line data dictionary	Header terms and line detail together define the proposal.
Estimate review before quotation	Validate business, pricing, and fulfillment assumptions before sending a quote.

Quotation

The proposal sent to the prospect or customer, usually printed from the estimate. Comes from: Estimate · Goes to: Customer Order · File: quotation.md · 6 Q&A rows

Topic covered	What it says
Estimate versus customer-facing quote	Estimate is the record; quote is the customer communication based on it.
Quote preparation and issue checklist	Check the customer document and record acceptance separately from quote issuance.
Revisions, expiration, and nonacceptance	Revisions and expiration need a documented local control; quote status alone does not book an order.
Information the customer-facing quotation should convey	A correct estimate is necessary, and the actual issued document needs its own check.
Accept, revise, or decline a quote	Customer response determines a distinct acceptance, revision, or loss path.

Customer

Master record: bill-to, ship-to, terms, credit limit, defaults. Comes from: Prospect (converted) · Goes to: Customer Order · File: customer.md · 8 Q&A rows

Topic covered	What it says
Meaning and forms	Customer setup controls the account and address defaults used downstream.
Set up and validate a customer	Review account, bill-to, ship-to, financial codes, and sales links before order entry.
Credit and balance are separate facts	Credit configuration and current balance need permission-aware, current ERP data.
Troubleshooting customer selection	Inspect party, ship-to, site, and conversion links when customer details look wrong.
Customer master field groups	Customer setup provides defaults; the saved transaction records the values actually used.
Conversion and first-order checks	Validate customer setup before the first order, particularly after prospect conversion.

Customer Order

Sales order header: customer, dates, terms, status, holds. Comes from: Estimate / Quotation · Goes to: Order Lines · File: customer_order.md · 9 Q&A rows

Topic covered	What it says
Purpose and form ownership	The order header controls the commercial transaction; lines specify demand.

Topic covered	What it says
Create and review an order	Save the header, add lines, then verify commercial, availability, and credit information.
Status, holds, and changes	Status and hold are different controls; explain the actual reason before proposing a change.
Order types and exceptions	Order type and options determine the relevant line, credit, shipment, and invoice workflow.
Troubleshoot an order that cannot progress	Diagnose the exact order and line state before changing it or escalating.
Header fields and downstream consequences	Header fields direct fulfillment and billing even when the lines are correct.
Order state questions and what to inspect	Booking, shipping, invoicing, and payment are separate evidence checkpoints.

Order Lines & Releases

What items, quantities and delivery dates are sold. Comes from: Customer Order · Goes to: Shipment · File: customer_order_line.md · 10 Q&A rows

Topic covered	What it says
Meaning and relationship to header	Diagnose item, quantity, price, source, and status on the individual line or release.
Enter and validate a line	A saved line still needs review of credit, sourcing, availability, and pricing.
Planned, Ordered, and credit checks	Review why a line is Planned before changing it to Ordered.
Availability, partials, and cross-references	Available inventory and a line's ready quantity are related but can differ.
Price changes and invoice hold	Recheck price after quantity changes and invoice hold before billing.
Line quantities and dates	The line/release is the right level for quantity and delivery questions.
Line-level investigation sequence	Trace a line from demand through supply, shipment, and billing.

Pricing & Discounts

Price lists, price codes and discounts used on estimates and orders. Comes from: Customer / Item · Goes to: Order Lines · File: pricing.md · 7 Q&A rows

Topic covered	What it says
Where pricing is reviewed	Review the pricing source and effective date for the specific customer, item, and line.
Price-check sequence for a line	Identify the exact price input and compare it with the customer's agreed terms.
Quote-to-order price handoff	Reconcile quote and order pricing after copying.
Pricing permissions and current amounts	Live customer-specific pricing needs an authorized, current ERP lookup.
Explain a price difference without guessing	Match all pricing inputs and separate base price, discounts, and charges.

Credit Review & Hold

Credit limit and credit hold rules that can block shipping. Comes from: Customer Order · Goes to: Shipment · File: credit.md · 8 Q&A rows

Topic covered	What it says
Customer credit, order hold, and parameters	Exceeding a limit does not always produce an automatic hold; inspect configuration and actual order state.
Diagnose a credit warning or blocked shipment	Investigate the actual hold flags, balances, parameters, and line status before explaining the block.
Place or release a hold	Credit release requires permission and may still leave a customer-level block.
Multi-site and subordinate customers	Corporate and multi-site credit require the configured SyteLine calculation.

Topic covered	What it says
Credit terms and evidence checklist	Identify the exact hold and the exposure calculation before explaining the restriction.

Fulfillment & Shipment

Picking, packing and shipping order lines; stock availability. Comes from: Order Lines + Credit OK · Goes to:

Invoice · File: shipment.md · 6 Q&A rows

Topic covered	What it says
What shipment means	Explain the actual fulfillment route and shipped quantity, not just the order status.
Standard fulfillment checklist	Check holds and supply, record actual quantities, and verify the posted shipment.
Partial shipment and backorder	Separate partial order readiness from partial line quantities and verify the actual remainder.
Troubleshooting a shipment that cannot post	A shipping error can arise from credit, availability, status, or logistics configuration.
Quantities, documents, and handoffs	Picking, posting shipment, and invoicing are separate events with different records.
Shipment-to-invoice handoff	Verify the posted shipment and invoice eligibility independently.

Invoice & Credit Memo

Billing the customer for shipped lines; credit memos for corrections. Comes from: Shipment · Goes to: Payment

· File: invoice.md · 5 Q&A rows

Topic covered	What it says
What creates an invoice	A standard order invoice follows a shipping transaction and an invoicing process.
Standard order invoicing steps	Verify shipped quantity and eligibility, process the invoice, then confirm A/R posting.
Due date, amount, and corrections	Use the transaction-specific correction path and preserve posted financial history.
Why an expected invoice is missing	Separate missing shipment, invoice hold, different billing route, and process error.
Invoice data and reconciliation	Reconcile the billed quantity and amount with shipment, order, and A/R.
Exceptions and correction path	Diagnose billing eligibility and preserve the posted transaction trail.

Payment & A/R

Receiving money and applying it to open invoices. Comes from: Invoice · Goes to: — (cycle complete) · File:

payment.md · 8 Q&A rows

Topic covered	What it says
What A/R tracks	Payment settles A/R items; order or shipment status alone does not prove settlement.
Record and apply a customer payment	Enter, distribute, post, and verify payment against the intended open item.
Aging and collections review	Aging is a report view of open receivables as of selected criteria.
Troubleshoot unpaid or unmatched items	Check payment posting and invoice distribution before concluding an invoice is unpaid.
Payment lifecycle and key fields	Payment entry, application, posting, and final invoice balance are different checkpoints.
Aging and dispute decisions	A/R follow-up requires invoice-level verification, not only an aging total.

Returns & Corrections

RMAs, credits and fixing mistakes after shipping or invoicing. Comes from: Shipment / Invoice · Goes to: Credit Memo / Reship · File: returns_and_corrections.md · 4 Q&A rows

Topic covered	What it says
When a return is needed	Use the return workflow for a post-shipment goods issue; preserve original transaction history.
General RMA flow	Authorize, receive, inspect, compensate, and reconcile a return.
Correct a bill without a physical return	Match the correction to the original transaction and document its financial effect.
Troubleshooting and approvals	Do not infer local return policy or post a credit from general documentation.
Choose the correction path	Choose a correction based on whether goods, billing, cash application, or unshipped demand is wrong.

CRM Setup & Navigation

Codes, statuses and setup values the CRM forms depend on. Comes from: Supporting · Goes to: Supporting · File: crm_setup.md · 9 Q&A rows

Topic covered	What it says
Purpose and boundary	CRM records connect the sales cycle but are not forced into a single conversion path.
Prepare reference values before entering CRM records	Configure status and classification values before entering or importing records.
Form map and ownership	Match the business question to its owning form; confirm technical mappings in the deployed site.
Local facts to capture for Phase 4	General knowledge can explain a form; live connector mappings need site validation.
Setup dependency order and validation	Configure controlled values, test linked records, and verify access before importing volume.

Customer Follow-up

Interactions, tasks and relationship management. Comes from: Supporting · Goes to: Supporting · File: customer_follow_up.md · 7 Q&A rows

Topic covered	What it says
Follow-up across the process	Record conversations in CRM, then verify operational facts in orders and A/R.
Follow up after a quote	Quote follow-up needs a recorded customer response and a separate order or loss decision.
Follow up after shipment and invoice	Customer service should trace order, shipment, invoice, and return evidence together.
Collection follow-up	Collection follow-up depends on current A/R detail and payment application.
Interaction record checklist	Follow-up is complete when the conversation and accountable next action are recorded.
Example follow-up questions by stage	Each follow-up question has an owning transaction or CRM record.

Form & Field Guide

Where each form and key field is, and what it means. Comes from: Supporting · Goes to: Supporting · File: form_field_catalog.md · 12 Q&A rows

Topic covered	What it says
How to use this guide	Use displayed labels for help; inspect the deployed site before using a field in an API.
Sales Contacts, Prospects, and Leads	A person, prospect company, lead, and interaction are separate records connected by references.

Topic covered	What it says
Opportunities and tasks	Forecast fields, outcome fields, tasks, and later order links answer different questions.
Estimate and quotation	Estimate header holds quote terms; lines hold item detail; the report is the customer document.
Customer and ship-to	Customer master, bill-to, and selected ship-to must be checked independently.
Customer order header and line	Header status, line status, holds, shipped quantity, and invoice hold answer distinct questions.
Shipment, invoice, and A/R	Shipment, billing, and cash application live in separate transactions and reports.
Frequently asked field meanings	Field names require form context and sometimes live values.

Cross-Process Guide

Questions that span several modules, end to end. Comes from: Supporting · Goes to: Supporting · File: faq.md · 8 Q&A rows

Topic covered	What it says
End-to-end map and alternate paths	Records form a linked commercial lifecycle with optional and repeated steps.
Trace one customer request through the forms	Follow identifiers and quantities from party to invoice and A/R rather than treating one status as the whole answer.
How to answer common user questions	Static knowledge explains process; transaction-specific answers require current, permitted ERP data.
What must be known before a precise answer	Resolve the record and screen context before giving a specific workflow or factual status.
Record relationships and identifiers	Link the correct organization, deal, order, line, shipment, invoice, and payment records.
Questions that need different answers	Definition, procedure, diagnosis, live lookup, and action are distinct intents.

5. How the chatbot uses data

The chatbot does not learn from the internet or remember training. It answers only from three kinds of files that we prepare. When the server restarts, it reads all of them, splits them into sections, turns each section into a vector (a list of numbers that captures meaning) and stores it in Milvus. There is no separate upload step: edit the file, restart, done.

Source	Location	Used for	Today
Knowledge files	data/knowledge/prospect_to_cash/*.md	Main source: explanations, steps, problems	18 files
Excel Q&A	data/qa/prospect_to_cash/*.xlsx	Exact, approved answers to common questions	132 rows
Glossary	data/metadata/business_glossary.csv	Abbreviations and synonyms (CO, RMA, SO)	15 terms

Golden rule

The chatbot repeats what the files say. A wrong sentence in a file becomes a wrong answer to users. Every fact must be confirmed by someone who does the work in SyteLine every day.

6. Knowledge files (Markdown)

Markdown is plain text with a few symbols for headings and lists. Any text editor can open it (Notepad, VS Code, PyCharm). One file per module.

6.1 Structure of a file

```

# Lead Module                                <- file title (one # )

## Capture and progress a lead                <- one topic = one section (## )

1. Confirm whether the organization is a Prospect or Customer.
2. Use a configured Lead Status. Record the source and quality.
3. Link the sales contact and set a follow-up.

**Section Summary:** Capture the party, need, owner, status and next
contact before creating an opportunity.      <- one sentence: what this answers

### Keywords
create lead, qualify lead, convert lead to opportunity  <- words users type
  
```

6.2 Sections every module should have

Section	What to write	Example question it answers
What is it	Meaning of the record in business terms, and the form it lives on	What is an opportunity?
Form and key fields	Each important field: what it means, when to fill it, allowed values	What does Probability mean?
How to create / process	Numbered steps in the order users do them	How do I create a customer order?
What comes next	The next form/record in the chain and how to get there	What do I do after the quotation is accepted?
Common problems	Symptom → cause → fix	Why can't I ship this order?
Examples	One or two realistic walk-throughs	Show me an example of a credit hold release

6.3 Writing rules

- **One topic per section.** The chatbot searches section by section; mixed topics give mixed answers.
- **Keep sections short.** About 5–15 lines. Split longer topics into two sections.
- **Use exact Syteline names.** "Customer Orders form", "Credit Hold" — the same words users see on screen.
- **Write steps as numbered lists.** The chatbot copies the order exactly.
- **Add a Section Summary and Keywords.** Keywords should include the users' casual words ("stuck order", "on hold").
- **Say when something is company-specific.** E.g. "Status values are defined by your site." Never guess local rules.
- **No screenshots inside the file.** The chatbot reads text only; describe what the screen shows.

Biggest gap today

"What comes next" sections are thin in most files, so questions like "what form do I use after converting the quotation?" get vague answers. Adding them is the quickest improvement.

7. Excel Q&A files

Use Excel Q&A for questions people ask often and whose answer is fixed. When a user's question matches a row closely, the chatbot shows the approved answer word for word; otherwise it writes an answer from the knowledge files.

7.1 Sheet qa_master — one row per question

Column	What to put	Example
qa_id	Unique id; never reuse	KB-0133
module / process	Module name	Credit
canonical_question	The clearest way to ask it	How do I release a credit hold?
answer	1–4 sentences, or short numbered steps	Only authorized users can release...
keywords	3–5 key words, comma-separated	credit hold, release, authorization
intent	HELP_GENERIC (what is), HELP_PROCESS (how/why), HELP_FIELD (a field)	HELP_PROCESS
source_reference / source_section	Which knowledge file and section it comes from	credit.md / Release a hold
approval_status	DRAFT until reviewed, then APPROVED	APPROVED
approved_by	Name of the business reviewer	A. Kumar (Credit team)
active	TRUE to use, FALSE to switch off without deleting	TRUE

7.2 Sheet question_variations — other ways to ask

Add at least three variations per question, in the words real users use — short, casual, or with typos. Each variation gets its own vector, so any of them will find the row.

qa_id	variation_id	question_variation
KB-0133	V1	credit hold release
KB-0133	V2	who can take the order off hold?
KB-0133	V3	my order is blocked by credit, how to unblock

7.3 Rules

- **Only APPROVED + active rows are used.** New rows start as DRAFT until a business user checks them.
- **The answer must agree with the knowledge file.** If they disagree, users get different answers to the same question.
- **Review needed now:** the current 132 rows were generated from the knowledge files and are marked "AUTO-DERIVED — pending SME review". Each module owner should review their rows.
- **Regenerating:** after big knowledge-file changes, the team can run `python -m scripts.build_qa_from_knowledge`. It REPLACES the Excel files, so copy any hand-written rows first.

8. Business glossary

The glossary teaches the chatbot your words. When a user types "SO" or "RMA", the chatbot also searches for the full term. One row per business term.

canonical_term	synonyms (separate with)	abbreviation	module
Prospect	potential customer lead contact		CRM
Lead	inquiry interested party		CRM
Opportunity	deal potential sale	OPP	CRM
Estimate	quote draft	EST	CRM
Quotation	quote proposal	QUO	CRM
Customer	client account	CUST	CRM
Customer Order	sales order order	CO	Order Entry
Order Line	line item order item		Order Entry
Due Date	delivery date expected date		Order Entry
Credit Limit	credit ceiling spending limit		Accounts Receivable
Credit Hold	credit block order hold		Accounts Receivable
Shipment	delivery dispatch		Shipping
Invoice	bill	INV	Accounts Receivable
Payment	remittance receipt		Accounts Receivable
Receivable	amount owed outstanding balance	AR	Accounts Receivable

Add every abbreviation and nickname users actually say, including internal slang.

9. Where to get content

Source	What you get	Value
Business users (sales, customer service, credit, A/R)	Real questions, real steps, real problems and fixes	Highest
Company SOPs and training material	Company-specific rules, approvals, codes	High
SyteLine itself (AIDEMO)	Exact form and field names, allowed values	High
Infor documentation	Standard behaviour of each form	Medium
Chatbot 🗣️ ratings and "No match found" answers	Exactly which questions need content next	High
Help-desk tickets / emails	The most common real problems	High

10. Quality rules and checklist

Check every new or changed section against this list before it goes live.

✓	Check
☐	One topic per section; section is 5–15 lines
☐	Form and field names match SyteLine exactly
☐	Steps are numbered and in the real order
☐	"What comes next" is included where it applies
☐	Section Summary and Keywords are present; keywords include users' casual words
☐	No guessed company rules; site-specific items are labelled as such
☐	No customer names, prices, passwords or personal data
☐	Excel answers agree with the knowledge file; rows reviewed and APPROVED
☐	New abbreviations added to the glossary
☐	Server restarted and 5–10 test questions answered correctly

11. Weekly routine and roles

Step	What to do	Who
1	Pick one module for the week	Chatbot team
2	30-minute session: collect real questions, steps and common problems	Business user + chatbot team
3	Update the module's knowledge file using the Part C template	Chatbot team
4	Add / review Excel Q&A rows and variations; set APPROVED	Business user reviews
5	Add new abbreviations to the glossary	Chatbot team
6	Restart the server and test 5–10 questions	Chatbot team
7	Check 🗳 ratings and "No match found" answers; plan next week	Chatbot team

At one module per week, all 18 modules are reviewed in about four months; start with the modules users ask about most (Customer Order, Credit, Shipment, Invoice).

12. Module fill-in template

Business users: fill one copy per module. Write in plain words; the chatbot team will turn it into the knowledge file.

Module name	e.g. Customer Order
Filled by / date	Name, team, date
What is it?	In 2–3 sentences, what this record means for the business
SyteLine form(s)	Exact form names users open
Key fields	Field name — what it means — when to fill it — allowed values
Steps to create / process	Numbered steps in the order you do them
What comes before	Which record/form leads here
What comes next	Which form you open next, and how
Common problems	Symptom → cause → fix (3–5 examples)
Who is allowed to do what	Roles that can create, change, approve, release
Company-specific rules	Approvals, codes, limits that are special to us
Top 10 questions users ask	In the users' own words

Words and abbreviations users use	e.g. SO = Customer Order
--	--------------------------

13. Q&A and glossary fill-in templates

13.1 Q&A rows

Question (clearest wording)	Approved answer (1–4 sentences)	3 other ways users ask it	Reviewed by

13.2 Glossary terms

Term	Other names / nicknames	Abbreviation	Module
